Message from the Guest Editors

Dear Colleagues,

Boundary value problems are usually associated with very-well-known real-life applications on the field of differential equations, and they are also providers of breakthrough developments on the theory of nonlinear analysis.

In this Special Issue, we will cover existence and localization results, based on the properties of Green's Function, of approximation theory, maximum principles, spectral analysis, and other techniques, providing special attention to original applied problems. Numerical analysis substantiating results are also valued.

Industrial problems, not directly relatable to differential equations but solved with nonlinear arguments, also fall within the scope of this Special Issue, so works focused on these matters are welcome to be submitted.
