Process Engineering, University  
of Surrey, Guildford GU2 7XH, UK

**Prof. Dr. José Antonio  
Odrizola**

Inorganic Chemistry Department  
and the Materials Science  
Institute, University of Seville, Av.  
Américo Vespucio 49, 41092  
Sevilla, Spain

**Dr. Laura Pastor-Pérez**

Department of Chemical and  
Process Engineering, University  
of Surrey, Guildford GU2 7XH, UK

Deadline for manuscript  
submissions:

**closed (31 December 2021)**

### Message from the Guest Editors

The growing trend of CO<sub>2</sub> emissions driven by the increase of global energy consumption makes mandatory a commitment of the scientific community to investigate routes for CO<sub>2</sub> valorisation. Chemical recycling may significantly contribute to a reduction of its emissions and represents an interesting alternative to the on-going studies on carbon capture and storage (CCS). In fact, despite the global efforts in reducing CO<sub>2</sub> emissions after the Kyoto Protocol and recently reconsidered in the Paris' Agreement, we are still far to meet the emissions levels requirements and herein catalysis will play a pivotal role.

In this scenario the spirit of this Special Issue is to gather advanced research on catalytic processes, new catalytic materials and novel approaches for CO<sub>2</sub> conversion to added value products. We welcome research papers and review articles dealing with fundamental and applied aspects of CO<sub>2</sub> upgrading. We also aim to showcase the success of catalysis as central tool to facilitate the transition towards low carbon societies. Join us to celebrate the successful story of catalysis for a low-carbon world.
