

Design of Functional Catalysts for Biomass Transformation into High Value-Added Commodities

Guest Editors:

Dr. Naresh Mamedu

Dr. Rajender Boddula

Dr. Ganesh Koyyada

Dr. Balla Putrakumar

Deadline for manuscript
submissions:

closed (30 June 2023)

Message from the Guest Editors

Replacing fossil resources with biomass, the sole organic carbon source, has recently attracted much attention because it may reduce reliance on fossil resources. Catalytic chemical processes may facilitate catalytic materials to increase product yields. This Special Issue explores the design and synthesis of novel, demanding, and robust catalytic systems for biomass transformation to address energy-related concerns with enormous potential for academic and industrial domains. This Special Issue will present high-quality, original research articles, communications, and reviews covering many recent advances in biomass valorization.

Potential topics include, but are not limited to: biomass valorization, lignocellulosic biorefineries, feedstock characterization and pretreatments, development of homogeneous and heterogeneous catalysts, liquid-phase and vapor-phase processes, catalytic processes, characterization and analytical techniques, biomass derivative chemicals, electro/photo/photoelectro catalytic biomass conversions, biomass-derived biofuels and their additives, and conversion pathways
