Message from the Guest Editor

Immunodeficiency, a simple impairment of immunity in a narrow sense, is characterized by severe and chronic/repetitive infection. However, it can also cause allergic diseases such as atopic dermatitis, as well as autoimmune and autoinflammatory diseases. The concept of immunodeficiency can be expanded to all types of immune dysregulation. Actually, the 2019 updated IUIS classification has defined primary immunodeficiencies as human inborn errors of immunity.

In this issue, current research topics on various aspects of allergy and immunodeficiency in children are welcome, in order to discuss what has been achieved, what is now going on, and what remains to be clarified in the field of pediatric allergy and immunodeficiency.
