Message from the Guest Editor

Pediatric rehabilitation is a medical subspecialty that helps children with a disability and those at risk of a disability due to a disease or accident in early childhood before growth and development are complete to minimize the effects of their disability and help them to develop appropriately for their age. The diseases in which pediatric rehabilitation can be applied include cerebral palsy, muscular dystrophy, traumatic brain injury, developmental delay, and other neurological and orthopedic problems. This Special Issue, titled “Physical Medicine and Rehabilitation in Children”, covers advances in knowledge and presents the results of novel research on diagnostic, prognostic, and therapeutic methods for the above-mentioned diseases. We anticipate that this Special Issue will help medical staff working in pediatric rehabilitation departments to advance their practical knowledge on diagnosis, prognosis, and treatment. We also hope that papers published in this Special Issue will generate ideas for new lines of research among researchers working in the field of pediatric rehabilitation.
