Deadline for manuscript submissions:

closed (20 April 2024)

Message from the Guest Editors

As a key sensory input, vision is pivotal in various aspects of a child's life, including learning, social networking, sports, and other activities. Healthy vision is not merely about clear sight.

Visual deficits in childhood can stem from a myriad of problems, ranging from refractive errors, strabismus, and amblyopia to various congenital or developmental disorders. If left undetected or untreated, these deficits can significantly impede a child's development.

The Special Issue aims to gather and present information about visual deficits in children, from their causes and impacts to the methods of detection and treatment. Our goal is to foster a deeper understanding of these issues and promote effective eye care strategies that can ensure children's visual health.

In this pursuit, we welcome original research articles, including epidemiological, observational, and experimental studies, clinical trials, and basic research. We also invite systematic or narrative reviews and meta-analyses. We look forward to your valuable contributions to it and advancing our understanding of this critical topic.
