Message from the Guest Editor

Dear Colleagues,

Fractures are extremely common in children. The fracture risk in boys is 40% and 28% in girls. Although many pediatric fractures are frequently regarded as “innocent” or “forgiving”, typical complications do occur in this precious population, e.g., premature physeal closure and post-traumatic deformity, which may cause life-long disability.

The main goal of this Special Issue of Children is to help fill the gap of undiscovered knowledge and improve the scientific understanding of pediatric fractures. Authors are invited to contribute to this Special Issue with original papers and reviews on all aspects related to pediatric fractures, including the diagnosis, treatment, or follow-up of common fractures. Authors are also encouraged to submit papers on specific pediatric injuries, as well as vulnerable populations such as children with bone disease. We also welcome articles that discuss important advancements and novel interventions on closely related topics, including high-energy trauma, perioperative care, and complication management.
