### **Message from the Guest Editor**

Dear Colleagues,

Mathematical modeling and the application of GIS are also important tools in predicting infectious diseases, identification of at-risk population, and the evaluation of interventions. This Special Issue on “Infectious Disease Epidemiology” will cover original articles and review articles related to global burden of infectious diseases, antimicrobial resistance, emerging diseases, social aspects and economic burden of diseases, laboratory identification, clinical trials, community interventions, GIS application, and mathematical models.

Prof. Dr. Amal K. Mitra
