Message from the Guest Editor

Dear Colleagues,

The availability of big data, fast communication channels, information openness, and the development of computer science have formed the base for a great number of financial innovations.

This Special Issue “Computational Macroeconomics” seeks empirical research papers that employ modern data science analysis methodologies and explore the wide range of publicly available open access big data databases. In particular, we would appreciate contributions on monetary policy and systemic risk; high frequency and informed trading; bank default risk and stress testing; money illusions and heterogeneous beliefs; international entrepreneurship in high economic growth countries; financial market volatility shocks and spillover effects in oil-dependent countries and agricultural transformation in rural countries.

Assoc. Prof. Alexander Borochkin
