Message from the Guest Editors

Dear Colleagues,

Poor nutrition is one of the major factors attributed to honey bee colony declines over the past decade. Habitat loss, intensive agriculture, monocultures, and changes in plant flowering phenology are most likely contributors to poor nutrition. Honey bee nutrition plays a vital role in mitigating the effects of both biotic and abiotic stressors on bees. Currently, there is huge gap in knowledge pertaining to honey bee nutrition. Given the importance of nutrition, it is imperative to understand honey bee nutrition holistically. In this Special Issue, we aim to publish original research articles pertaining to honey bee nutrition.
