Message from the Guest Editors

Individual differences research focused in cognitive abilities and personality traits has been relatively successful in predicting human behavior. Very early on, interindividual difference researchers included a wide array of different constructs including personality traits and cognitive abilities.

The purpose of this Special Issue is to bring these two traditions back to the discussion table and to underscore the relevance of an integrative perspective for both individual differences and developmental research.

We invite papers presenting empirical studies testing models including cognitive abilities and personality traits, along with theoretical proposals based on available evidence. Psychometric, information processing, and biological perspectives are welcome.
