# Bidirectional Associations between Oral Conditions, Glucose Abnormalities and Potential Nutrition-Related Mediators

Guest Editor:

#### Prof. Dr. Kaumudi J. Joshipura

Department of Epidemiology, Harvard T. H. Chan School of Public Health, Boston, MA 02115, USA

Deadline for manuscript submissions:

closed (30 September 2021)

## Message from the Guest Editor

Periodontitis is one of the potential complications of diabetes. Conversely, periodontitis could lead to tooth loss, which in turn could detrimentally impact dietary intake and lead to chronic disease like diabetes. Potential mediators include dietary and nutritional factors, dyslipidemia, markers of inflammation and endothelial dysfunction, and advanced glycation end-products.

In addition to diabetes, several glucose abnormalities such as insulin resistance, impaired glucose tolerance, and prediabetes have been evaluated in a few studies in this context, and findings are inconsistent. Longitudinal studies relating periodontitis and glucose abnormalities show inconsistent results in both directions. The causal of these associations interpretations are complicated by numerous common risk factors that may confound the associations. More research is needed to better understand these associations, the reasons for inconsistencies, causal interpretation, and understanding pathways for these associations. This Special Issue welcomes original manuscripts and review articles that provide insight or new data to better understand these associations

## **Message from the Editorial Board**

*Nutrients* is an on-line open access journal that was first published in 2009. *Nutrients* adheres to rigorous peerreview and editorial processes and publishes only high quality manuscripts that address important issues related to the impacts of nutrients on human health. The Impact Factor of *Nutrients* has risen rapidly since its establishment and it is now ranked in the first quartile of journals publishing in the field of nutrition and dietetics research.
