Message from the Guest Editors

The threat of viral zoonotic infections has been underscored by the current COVID-19 pandemic and the suggested links of severe acute respiratory syndrome coronavirus-2 (SARS-CoV-2) and its emergence from a bat reservoir. Simultaneously, the world faces an unprecedented crisis at an increasing scale in both intensity and frequency with the ravages of climate change. This includes severe weather systems, floods, droughts, and wildfires, all of which can severely impact on human health through a change or shift in viral zoonotic disease dynamics. Viral zoonoses and climate change are currently viewed as perhaps the most dangerous natural threats to global human health. A better understanding of the role of climate change in the transmission dynamics of viral zoonotic diseases is greatly needed.

Message from the Editor-in-Chief

The worldwide impact of infectious disease is incalculable. The consequences for human health in terms of morbidity and mortality are obvious and vast but, when infections of animals and plants are also taken into account, it is hard to imagine any other disease that has such a significant impact on our lives—on healthcare systems, on agriculture and on world economics. *Pathogens* is proud to continue to serve the international community by publishing high quality studies that further our understanding of infection and have meaningful consequences for disease intervention.

Author Benefits

Open Access: free for readers, with article processing charges (APC) paid by authors or their institutions.

High Visibility: indexed within Scopus, SCIE (Web of Science), PubMed, PMC, Embase, PubAg, CaPlus / SciFinder, AGRIS, and other databases.

Journal Rank: JCR - Q2 (*Microbiology*) / CiteScore - Q2 (*General Immunology and Microbiology*)
